Directorate / Region	RMO – Kimberley Region	Main Roads or Contractor	Contractor
EQSafe Event Type	Injury / Illness	EQSafe Incident Number	58142
Actual Consequence	Moderate	Potential Consequence	Moderate

Incident Short Description	Culvert worker received manual handling injury, resulting in an LTI
-----------------------------------	---

What Happened
At approximately 2:00 PM, a contracted culvert crew was performing slab preparation works. The crew were relocating a section of reinforcing steel mesh approximately 2400 mm x 6000 mm wide from the embankment into the slab trench using manual handling methodologies. The IP (Injured Person) commenced a multi-person lift with two other crew members and as the load was raised from the ground to a raised position, the IP felt a sharp pain in the lower left side of their back. The lift was continued and the reinforcing steel mesh was carried to its final resting position. Although with some discomfort and restricted movement, the IP continued to work for the remainder of shift ending the shift at approximately 5:00 PM and returning to camp. The IP continued to feel discomfort throughout the evening and subsequently notified the Project Manager the following morning. After being notified of the incident the IP was transported to Halls Creek Hospital for triage, assessment and treatment, and was certified as being unfit for duties for two days, resulting in an LTI. A formal ICAM investigation has commenced. Once completed, the lessons learnt will be communicated/ shared through a final Grey Banner Alert as soon as practicable.
