

Item (Generic / Site Specific)		Risk Event	Consequence	Pre-treatment Risk			Treatment	Residual Risk			
				L	C	RR		L	C	RR	
3.2.	14	3 G	Use of Portable Traffic Control Devices as a safety precaution deemed unsuitable because of site constraints and duration of works causing increased exposure for Traffic Management personnel to live traffic resulting in serious injury or fatality.	Serious injury or fatality.	C	4	H12	Refer to section 4.1.7 of this TMP for the use of Portable Traffic Control Devices on Main Roads and Local Government networks. It is recommended that PTC'D's are considered for all scenarios (where PTC'D is not mandatory) however, it is acknowledged that it is not feasible for all traffic management setups. Where Traffic Controllers are used in the excepted scenarios provided in section 4.1.7 they must be accompanied with a site-specific risk assessment. A variation to the standards form, signed by an RTM and approved by the Road Authority is required where PTC'Ds are removed due to roadside features. Refer to the above Traffic Controller considerations when operating under manual traffic control.	D	4	M8
3.2.	14	4 G	Roadside features and insufficient space preventing the use or requiring the relocation of Portable Traffic Control Devices on the Main Roads network. Motorists may have little advanced warning of Traffic Control Devices and break excessively causing an increase in rear end crashes resulting serious injuries or fatality.	Serious injuries or fatality.	C	4	H12	Traffic Management Personnel to risk assess the placement of signs and devices where not suitable to apply as per the Traffic Management advice. Signs and devices may be adjusted as per the tolerances. All changes to the proposed Traffic Management setups must be risk assessed and recorded within the daily diary. Where PTC'D's need to be removed and replaced with manual traffic control it must be a risk assessment variation to the standards and approved by an accredited RTM.	D	4	M8
