

Figure 2.2: Speed to be used for advance warning sign spacing

Where a sign spacing is partially within the 200 m zone after a speed limit change, use the higher speed limit in determining the relevant full spacing (even though only part of this spacing may be within this zone).

Tapers which are partially within the 200 m zone after a speed limit change are to use the higher speed limit in determining the relevant full taper length (even though only part of the taper length may be within this zone).

The following figures illustrate the relationship between a speed zone change and the spacing / distance applicable to signs or hazards (such as a taper).

Where traffic speed is substantially different (± 10 km/h or more) to the posted or temporary speed zone values, refer to Section 2.5.9 for the speed value to use in the tables.

Figure 2.2(a) – Sign or hazard within 200 m of a speed zone change
