

3.3 Site-Specific Risk Register

A comprehensive site-specific risk assessment must be completed prior to any works commencing, particularly under Short Term Low Impact or Mobile work scenarios. This risk assessments must identify and analyse any potential safety risks likely to arise during the proposed works. The identification of each risk must be followed by the defining of the appropriate mitigating measures.

Where there are risks identified at the planning stage (prior to crews arriving on site) these risks must be addressed in pre-start meetings and when considering whether the works can be completed safely. Additional site-specific risks must be considered prior to the works commencing and the below tables outline some considerations (this is not an exhaustive list and other risk considerations may be applicable)

3.3.1 Risk Considerations

Table 8: AGTTM Part 4 & 5 Section 2.2.1 Risk Consideration Table 2.1

Risk Category	Considerations
Short-Term Low Impact	- Reduction in level of traffic management standard compared to a static worksite. - Risk and exposure to roadside workers, particularly those implementing traffic management setups. - Existing traffic volumes - Speed compliance - Existing speed and worker clearances - Road geometry including crests, hills, curves, and bends. - Road user behaviours. - Safe escape routes for workers within live traffic lanes.
Mobile Works Scenarios	- Workers on foot in constantly moving setups. - Significantly reducing the existing speed of the road to accommodate vehicles in lane. - Reduction in level of traffic management standard compared to a static worksite. - Existing traffic volumes particularly on single lane each direction roads. - Confusion to motorists of procedures around mobile works. - Speed compliance. - Road geometry including crests, hills, curves, and bends. - Road user behaviours. - Safe escape routes for workers within live traffic lanes.
Road Worker Safety	- Maintenance of an acceptable clearance from traffic. - Appropriate training for all road workers and compliance of appropriate work methods and safety requirements. - Complacency because of frequency of activities. - Maintaining appropriate separation of all tasks, for example lookout persons being requested to undertake additional tasks. - Higher risk exposure when undertaking short-term low impact works. - Time constraints associated with the short-term nature of works. - Work pressures. - Use of correct PPE. - Reporting and managing unsafe conditions or incidents. - Compliance to traffic management advice.
Road Users	- Unsafe reactions because of surprise (i.e insufficient advanced warning of work activities). - Response to stationary vehicles or plant parked near the road. - Restricted sight lines due to plant, signs, or devices. - Hazards created by work equipment or debris. - Driver behaviour, human error, and errant vehicles. - Hazards that impact road users. - Special requirements for oversized special vehicles.
