

Vulnerable Road Users	• Impacts to vulnerable road user facilities causing unsafe manoeuvres. • Road features or temporary traffic management setups that are hazardous for motorcyclists or on-road cyclists. • Changes in pavement level or surface conditions. • Detours or traffic management on-site advice leading pedestrians or cyclists into unsafe conditions. • Conflicting traffic management advice for vulnerable road users. • Pedestrians with impaired visions, mobility or hearing limitations.
Site Conditions	• Road category and traffic volumes relative to the proposed work times. • Allowance for unexpected changes to traffic volumes due to adjacent worksites or events. • Traffic profile including, buses, trucks, and other oversized vehicles. • Traffic speed compliance and worker clearances. • Sight distances due to vegetation and other road side furniture. • Road features including, sealed roads, condition of seal, unsealed roads, available lanes, shoulder widths, signalised intersections, railway crossings, and bridges. • Access to driveways and laneways which may impact traffic management and works setups. • Night work considerations including lighting and PPE requirements. • Drainage management during particular tasks and environments.
Parked Vehicles Including Work Vehicles	• Physical obstructions that can be collided with. • Obstructions that cause sudden braking and rear end crashes. • Obstructions that deflect vehicles into adjacent live traffic lanes. • Hazards to passing vehicles and vulnerable road users (particularly cyclists). • Obstructions that mask or hide pedestrians. • Obstructions that block visibility at intersections and access points (driveways and laneways) • Vehicles placed within lane without appropriate vehicle mounted warning devices or flashing arrow boards. • Ensuring it does not impact visibility to existing and temporary sign and device requirements. • Blocking of pedestrian and cyclists facilities causing potentially unsafe manoeuvres. • Access to and departure from the worksite in a safe and compliant manner.
Adverse Weather Conditions	• Increasing sign distance placement due to poor visibility. • Installing sign weights to prevent signs from falling over. • Securing signs and devices during adverse weather conditions. • Work considerations for safe completion (can the works be completed in weather condition?). • Sun glare reduced visibility to signs and devices.
